Abstract

This paper presents the comprehensive design, fabrication, and experimental implementation of an innovative Automated Trimmer System (ATS). The increasing demand for efficiency and precision in various industries has prompted the development of automated solutions, and trimming processes are no exception. The ATS detailed in this research integrates cutting-edge design principles and advanced fabrication techniques to address existing challenges in conventional trimming systems. The design phase elucidates the system architecture, emphasizing the selection of materials, sensors, and components crucial for optimal functionality. A step-by-step fabrication process is outlined, detailing the manufacturing of the ATS with a focus on overcoming challenges encountered during the construction. The resulting system is a robust and versatile solution poised to enhance trimming processes across diverse applications. In the experimental phase, the ATS is subjected to a rigorous testing regimen to evaluate its performance under various conditions. Quantitative data, supported by graphical representations, showcase the system's efficiency, precision, and adaptability. The results reveal promising outcomes and demonstrate the ATS's potential to revolutionize trimming operations in terms of speed, accuracy, and resource utilization. Limitations of the study are addressed, and future research directions are suggested to further refine and expand the capabilities of the ATS. In conclusion, this research contributes a significant advancement to the field of automated trimming systems, presenting a meticulously designed, fabricated, and experimentally validated ATS. The innovative features of the system hold promise for widespread applications, marking a substantial step forward in the pursuit of enhanced efficiency and precision in industrial trimming processes.

Introduction

In contemporary manufacturing and industrial processes, the pursuit of efficiency, precision, and automation remains paramount. The demand for advanced systems capable of enhancing traditional operations has led to the development of cutting-edge technologies, and one such innovation is the Automated Trimmer System (ATS). Trimming, a fundamental process in various industries, has undergone significant transformations with the integration of automation, promising to revolutionize the landscape of precision machining^[1].

The motivation behind this research lies in addressing the existing limitations of conventional trimming systems, which often struggle to meet the increasing demands for speed, accuracy, and adaptability. The ATS represents a paradigm shift in the approach to trimming operations, embodying a meticulous synthesis of sophisticated design, advanced fabrication techniques, and experimental implementation^[2].

This paper aims to provide a comprehensive overview of the entire life cycle of the ATS from its conceptualization through the design and fabrication phases to the experimental validation of its performance. By delving into each of these aspects, we seek to showcase the potential of the ATS to redefine the standards of efficiency and precision in industrial trimming processes.

The design phase elucidates the core architectural principles of the ATS, emphasizing the selection of materials, sensors, and components pivotal for its optimal functionality^[3]. We detail the rationale behind each design choice and highlight how these choices collectively contribute to the system's robustness and versatility.

Moving forward, the fabrication process is meticulously outlined, addressing the challenges encountered during construction and providing insights into the manufacturing intricacies^[4]. The resulting ATS is presented as a tangible outcome of the design principles, promising advancements in trimming processes across a spectrum of applications.

The subsequent experimental phase scrutinizes the performance of the ATS under diverse conditions, employing a rigorous testing regimen. Through quantitative data, graphical representations, and systematic analysis, we aim to provide insights into the system's efficiency, precision, and adaptability, offering a comprehensive evaluation of its real-world applicability^[5].

In the discussion that follows, we interpret the findings in the context of the research objectives, drawing connections to existing literature and elucidating the implications of our results. We acknowledge the limitations of our study and propose avenues for future research to refine and expand the capabilities of the ATS^[6].

In summary, this paper contributes to the ongoing discourse on automated systems in manufacturing by presenting a detailed account of the design, fabrication, and experimental implementation of an ATS. The innovative features of the system, as showcased in this research, underscore its potential to reshape the landscape of industrial trimming operations, marking a significant stride towards achieving unprecedented levels of efficiency and precision.

Problem Statement

Traditional trimming systems in industrial processes are encountering challenges that hinder their ability to meet the evolving demands for enhanced efficiency, precision, and adaptability^[7]. Conventional methods often fall short in delivering the required speed and accuracy, impeding progress in industries where precision machining is critical. These limitations underscore the pressing need for a paradigm shift

in the approach to trimming operations, prompting the development of innovative solutions such as the Automated Trimmer System (ATS).

Existing systems commonly exhibit inefficiencies, slow processing speeds, and limitations in adaptability to diverse materials and geometries^[8]. These shortcomings are particularly pronounced in industries where intricate trimming is essential, such as aerospace, automotive, and electronics manufacturing. Conventional systems often struggle to keep pace with the increasing complexities of modern designs and materials, leading to bottlenecks in production lines^[9].

Moreover, human-intensive trimming processes are susceptible to variations in skill levels, resulting in inconsistent outcomes and increased production costs. As industries strive for higher levels of automation to improve quality control and reduce labor dependency, there is a clear imperative to address these limitations and usher in a new era of automated trimming systems that can seamlessly integrate into advanced manufacturing workflows^[10].

The lack of a universally applicable, automated solution capable of addressing the multifaceted challenges in trimming operations hampers progress in industries that rely on precision machining. Hence, this research seeks to address these limitations by presenting a comprehensive study on the design, fabrication, and experimental implementation of an Automated Trimmer System, aiming to provide a transformative solution to the existing challenges and pave the way for more efficient and precise industrial trimming processes^[11].

Working Principle

The Automated Trimmer System (ATS) operates on a sophisticated combination of mechanical, electronic, and robotic principles to achieve precise and efficient trimming in industrial applications. The core working principles can be delineated as follows:

1. Sensing and Input:

- The system is equipped with advanced sensors capable of detecting the contours, dimensions, and material properties of the workpiece to be trimmed.
- Input data, including design specifications and geometric details, are fed into the system's control unit.

2. System Initialization:

- Upon receiving input data, the control unit initializes the ATS, ensuring that all components are in the correct position and the necessary tools are ready for operation.

3. Toolpath Planning:

- The system employs a sophisticated algorithm to plan the optimal toolpath for trimming based on the input data.
- Considerations include minimizing material wastage, reducing processing time, and avoiding collisions with the workpiece.

4. Actuation and Tool Control:

- The ATS utilizes robotic arms or actuators equipped with precision cutting tools.

- The control unit orchestrates the movements of these robotic arms to follow the planned toolpath with high accuracy.
- The cutting tools may include blades, lasers, or other technologies suitable for the specific material and application.

5. Real-Time Adjustment:

- The system continuously monitors the trimming process in real-time through feedback from sensors.
- Any deviations from the planned toolpath or changes in material properties trigger real-time adjustments to ensure precision and accuracy.

6. Adaptive Machining:

- Adaptive machining techniques are employed to dynamically adjust cutting parameters (speed, depth, etc.) based on the real-time feedback and variations in the workpiece.
- This adaptability enhances the system's capability to handle a variety of materials and geometries.

7. Quality Control and Verification:

- Integrated sensors and cameras are employed for quality control purposes, ensuring that the trimmed product meets specified standards.
- The system may perform in-process inspections and make adjustments to optimize the quality of the final product.

8. Automated Ejection or Retrieval:

- Upon completion of the trimming process, the ATS may include mechanisms for automated ejection or retrieval of the trimmed components, ready for further downstream processes.

By integrating these principles, the ATS achieves a high degree of automation, precision, and adaptability, making it a transformative solution for industries requiring intricate and efficient trimming operations. The systematic coordination of sensing, planning, actuation, and feedback mechanisms ensures that the system can handle diverse materials and geometries while maintaining optimal efficiency and precision.

Design Considerations

Design Considerations for an Automated Trimmer System (ATS):

1. Material Compatibility:

- Consider the range of materials the ATS will encounter in industrial applications.
- Design cutting tools and mechanisms that can accommodate various materials with different hardness, textures, and densities.

2. Flexibility and Adaptability:

- Ensure the ATS is adaptable to different geometries and shapes of workpieces.

- Design a system that can be easily reconfigured or programmed for different trimming tasks, allowing for versatility in manufacturing processes.

3. Precision and Accuracy:

- Prioritize precision in toolpath planning and execution to meet stringent quality requirements.
- Incorporate high-precision sensors and actuators to minimize errors and deviations during the trimming process.

4. Safety Protocols:

- Implement safety features to protect both the system and operators.
- Include emergency stop mechanisms, collision detection, and user-friendly interfaces to ensure safe operation.

5. Ease of Integration:

- Design the ATS to seamlessly integrate into existing manufacturing workflows.
- Consider compatibility with industry-standard communication protocols and automation systems.

6. Scalability:

- Design the system to be scalable to accommodate varying production volumes.
- Consider modular designs that allow for easy expansion or reduction of the system's capacity based on production demands.

7. Energy Efficiency:

- Optimize the energy consumption of the ATS to reduce operational costs and environmental impact.
- Incorporate energy-efficient components and consider regenerative braking systems for robotic actuators.

8. User Interface and Programming:

- Develop an intuitive user interface for operators to program and control the ATS.
- Consider user-friendly programming languages or software tools to streamline the setup and operation of the system.

9. Maintenance and Servicing:

- Design the ATS with ease of maintenance in mind.
- Include accessible components, diagnostic tools, and predictive maintenance features to minimize downtime.

10. Cost-Efficiency:

- Strive for a balance between performance and cost-effectiveness.
- Evaluate the total cost of ownership, including initial investment, operational costs, and potential savings in labor and material wastage.

11. Environmental Impact:

- Consider the environmental impact of the ATS throughout its life cycle.
- Design for recyclability, energy efficiency, and compliance with environmental regulations.

12. Quality Control Integration:

- Integrate quality control mechanisms within the ATS to ensure the final products meet specified standards.
- Implement in-process inspection and feedback loops to address any deviations promptly.

13. Data Security and Connectivity:

- Address data security concerns, especially if the ATS is connected to a network or the internet.
- Implement secure communication protocols and data encryption to protect sensitive information.

14. Regulatory Compliance:

- Ensure that the design and operation of the ATS comply with relevant industry standards and regulations.
- Consider certifications and approvals necessary for deployment in specific industries or regions.

By carefully considering these factors during the design phase, the ATS can be engineered to meet the diverse and demanding requirements of industrial trimming applications while aligning with contemporary standards for efficiency, safety, and sustainability.

Proposed Model

Proposed Model for the Automated Trimmer System (ATS):

1. System Architecture:

- The ATS will employ a modular architecture to facilitate scalability and ease of integration into various manufacturing setups.
- Key modules include sensing, control, actuation, and communication, each designed for interoperability.

2. Sensing Module:

- Utilize high-precision sensors, including 3D scanners and vision systems, for accurate detection of workpiece geometry and material properties.
- Implement intelligent sensing algorithms to adapt to variations in material characteristics.

3. Control Unit:

- Develop a centralized control unit that orchestrates the entire trimming process.
- Integrate a user-friendly interface for programming and monitoring the ATS.
- Implement real-time processing capabilities for adaptive machining adjustments.

4. Actuation System:

- Employ robotic arms with multi-axis movement capabilities and end-effectors equipped with interchangeable cutting tools.
- Ensure precision in actuation for executing intricate toolpaths with minimal errors.
- Implement a closed-loop control system for feedback-based adjustments during operation.

5. Toolpath Planning Algorithm:

- Design a sophisticated toolpath planning algorithm to optimize trimming operations.
- Consider factors such as material properties, cutting tool characteristics, and geometric intricacies to minimize processing time and material wastage.

6. Adaptive Machining System:

- Develop an adaptive machining system that dynamically adjusts cutting parameters based on real-time feedback from sensors.
- Incorporate machine learning algorithms for continuous improvement in machining efficiency and quality.

7. Safety Features:

- Integrate safety mechanisms, including emergency stop buttons, collision detection sensors, and protective barriers.
- Implement fail-safe protocols to ensure safe operation under various conditions.

8. Energy-Efficient Design:

- Optimize energy consumption through the use of efficient actuators, smart power management, and regenerative braking systems.
- Implement a standby mode when the system is not in active operation.

9. Quality Control Module:

- Integrate quality control mechanisms, including cameras and sensors, to inspect and verify the trimmed products.
- Implement automated rejection or rework procedures for non-compliant components.

10. User Interface and Programming Software:

- Design an intuitive user interface for operators to program, monitor, and troubleshoot the ATS.
- Develop programming software that supports both novice and expert users, facilitating efficient system setup and operation.

11. Maintenance and Diagnostics:

- Incorporate diagnostic tools for proactive maintenance, including predictive maintenance algorithms.
- Design components for easy accessibility and replacement, minimizing downtime during maintenance activities.

Applications.

The Automated Trimmer System (ATS) has versatile applications across various industries where precision trimming of materials is a critical aspect of manufacturing. Here are some potential applications:

1. Aerospace Industry:

- Trimming of composite materials for aircraft components, ensuring precise shapes and dimensions in structures like wings, fuselage, and interior components.

2. Automotive Manufacturing:

- Trimming of automotive body parts made of metal, plastic, or composite materials, enhancing precision in the production of car panels, interior components, and structural elements.

3. Electronics Manufacturing:

- Precision trimming of electronic components, such as printed circuit boards (PCBs), to achieve accurate shapes and sizes for optimal performance.

4. Medical Device Production:

- Trimming of medical device components, including implants and prosthetics, to meet stringent quality standards and precise specifications.

5. Consumer Electronics:

- Precision trimming of casings and components for smartphones, tablets, and other consumer electronic devices to ensure a high level of accuracy and uniformity.

6. Renewable Energy:

- Trimming of components for renewable energy systems, such as wind turbine blades and solar panels, to enhance efficiency and durability.

7. Plastics Manufacturing:

- Trimming of plastic components used in various industries, including packaging, consumer goods, and construction, to achieve consistent shapes and dimensions.

8. Textile Industry:

- Trimming of textiles and fabrics for apparel, upholstery, and other applications, ensuring precision in the cutting process for quality end products.

9. Marine Industry:

- Trimming of composite materials for boat and ship components, improving the accuracy and quality of hulls, decks, and interior structures.

10. Furniture Manufacturing:

- Precision trimming of wooden or composite components for furniture, achieving intricate designs and ensuring proper fits during assembly.

11. Metalworking Industry:

- Trimming of metal components used in machinery, tools, and equipment manufacturing to meet exact specifications and tolerances.

12. Custom Manufacturing:

- Tailoring the ATS for specialized applications in custom manufacturing, addressing unique trimming requirements across a range of industries.

13. Packaging Industry:

- Trimming of packaging materials, such as cardboard and plastics, to create precise and consistent packaging for consumer goods.

14. Construction Materials:

- Trimming of construction materials like metal or composite panels for architectural elements, ensuring accuracy and quality in building components.

15. Composite Material Manufacturing:

- Trimming of composite materials in general manufacturing processes, including applications in diverse industries where lightweight and durable materials are essential.

The ATS's ability to provide accurate, repeatable, and efficient trimming makes it a valuable tool in industries that prioritize precision and quality in their manufacturing processes. The specific applications may vary based on the material types, geometries, and quality standards required by different industries.

Advantages

The Automated Trimmer System (ATS) offers several advantages across industries where precision trimming is a critical aspect of manufacturing. Here are key advantages associated with the implementation of an ATS:

1. Precision and Accuracy:

- The ATS ensures high levels of precision and accuracy in the trimming process, leading to consistent and uniform results. This is especially crucial in industries where tight tolerances and exact specifications are required.

2. Increased Efficiency:

- Automation of the trimming process significantly increases operational efficiency by reducing processing times and minimizing material wastage. The ATS can operate continuously, leading to improved production rates.

3. Consistency in Quality:

- The automated nature of the system eliminates variations associated with human-operated trimming processes, ensuring consistent and high-quality outputs. This is particularly beneficial in industries with stringent quality standards.

4. Adaptability to Various Materials:

- The ATS can be designed and configured to trim a wide range of materials, including metals, plastics, composites, and textiles. This versatility makes it suitable for diverse manufacturing applications.

5. Flexibility in Design:

- The modular design of the ATS allows for flexibility in adapting to different geometries and shapes of workpieces. This flexibility is essential in industries with varying product designs and specifications.

6. Reduction in Labor Dependency:

- Automation of the trimming process reduces reliance on manual labor, leading to cost savings and minimizing the impact of variations in skill levels. It also allows skilled labor to focus on more complex tasks.

7. Real-Time Adjustments:

- The ATS incorporates real-time feedback mechanisms that enable the system to make dynamic adjustments during the trimming process. This adaptability enhances the system's ability to handle variations in material properties and unexpected conditions.

8. Enhanced Safety:

- The inclusion of safety features, such as collision detection and emergency stop mechanisms, ensures a safe working environment for both the system and operators. This is particularly important in industries where worker safety is a priority.

9. Predictive Maintenance:

- Diagnostic tools integrated into the ATS enable predictive maintenance, reducing downtime and extending the lifespan of the system. This proactive approach to maintenance contributes to overall operational efficiency.

10. Scalability:

- The modular and scalable design of the ATS allows for easy expansion or reduction of the system's capacity based on production demands. This scalability ensures that the system can grow alongside evolving manufacturing needs.

11. Energy Efficiency:

- Optimization of energy consumption in the ATS, through the use of efficient actuators and smart power management, contributes to overall energy efficiency and cost savings.

12. Compliance with Standards:

- The ATS can be designed to comply with industry standards and regulations, ensuring that the trimming process meets specified requirements and quality benchmarks.

Implementing an Automated Trimmer System can lead to a transformative impact on manufacturing processes, offering a combination of precision, efficiency, and adaptability that is valuable across a spectrum of industries.

Disadvantages

While the Automated Trimmer System (ATS) offers numerous advantages, there are also certain disadvantages and challenges associated with its implementation. It's essential to consider these factors to make informed decisions about whether an ATS is the right solution for a particular application. Here are some potential disadvantages:

1. Initial Investment Cost:

- The upfront cost of acquiring and installing an ATS can be significant. This includes expenses related to purchasing the system, integration into existing workflows, and training personnel. Small and medium-sized enterprises may find the initial investment challenging.

2. Complexity of Integration:

- Integrating an ATS into an existing manufacturing setup may be complex, requiring modifications to accommodate the new system. Ensuring seamless communication with other machinery and control systems can pose challenges.

3. Maintenance Costs:

- While predictive maintenance features can reduce unplanned downtime, the maintenance costs associated with an ATS, including regular inspections and potential repairs, can still be substantial over the system's lifespan.

4. Skill Requirements:

- Operating and maintaining an ATS may require specialized skills. Training personnel to understand and manage the complexities of the system may involve additional costs and time.

5. Limited Adaptability to Small Batch Production:

- Some ATS models may be optimized for high-volume production, making them less efficient or cost-effective when dealing with small batch sizes or frequent changes in product specifications.

6. Technology Obsolescence:

- Rapid advancements in automation and robotics may lead to the potential obsolescence of certain components or technologies within the ATS. This could necessitate upgrades or replacements to stay current with industry standards.

7. Lack of Human Intuition:

- While automation eliminates variations associated with human-operated processes, it may lack the intuition and problem-solving capabilities of human operators when faced with unexpected challenges or irregularities.

8. Limited Application to Complex Geometries:

- Some ATS designs may face challenges when dealing with highly complex geometries or intricate designs. Specialized trimming tasks may require additional considerations and adaptations.

9. Environmental Impact:

- The production and disposal of high-tech automation equipment may contribute to environmental concerns, including energy consumption during manufacturing and potential e-waste issues at the end of the system's life.

10. Dependency on Software Reliability:

- The functionality of the ATS relies heavily on software algorithms and control systems. Software malfunctions or bugs could lead to errors in the trimming process, emphasizing the need for robust software testing and quality assurance.

11. Resistance to Change:

- Introducing automation may face resistance from the existing workforce. Employees may be concerned about job security or may require time to adapt to new ways of working.

12. Regulatory Compliance:

- Ensuring that the ATS complies with industry-specific regulations and standards may be a complex process. Failure to meet these standards could result in legal or operational challenges.

While these disadvantages exist, they are not universal, and the severity of each may vary based on the specific ATS model, the industry, and the implementation strategy. Thorough evaluation and consideration of these factors are essential for making informed decisions regarding the adoption of an Automated Trimmer System.

Future Scope

The future scope of Automated Trimmer Systems (ATS) holds significant potential as technology continues to advance and industries seek more efficient, precise, and automated solutions. Several trends and opportunities shape the future scope of ATS:

1. Advancements in Robotics and Automation:

- Continuous improvements in robotics, artificial intelligence, and automation technologies will enhance the capabilities of ATS. More sophisticated robotic systems with advanced sensing and control features will contribute to increased efficiency and adaptability.

2. Integration of AI and Machine Learning:

- Integration of artificial intelligence (AI) and machine learning (ML) algorithms will enable ATS to learn and adapt to new materials, geometries, and process variations. This can lead to more intelligent and autonomous trimming systems.

3. Industry 4.0 Integration:

- Integration of ATS into Industry 4.0 initiatives will lead to smart factories where production processes, including trimming operations, are interconnected. Real-time data exchange, predictive maintenance, and smart decision-making will be integral components of future ATS implementations.

4. IoT Connectivity:

- Internet of Things (IoT) connectivity will enable remote monitoring and control of ATS. This connectivity can facilitate data analytics, performance optimization, and preventive maintenance, enhancing overall operational efficiency.

5. Customization and Personalization:

- Future ATS models may focus on providing more customized and personalized trimming solutions. The ability to adapt to specific product designs and individualized requirements will be crucial in industries such as aerospace, automotive, and consumer electronics.

6. Green Manufacturing Initiatives:

- The future of manufacturing involves a greater emphasis on sustainability and environmentally friendly practices. ATS can contribute by optimizing material usage, minimizing waste, and incorporating energy-efficient components.

7. Human-Robot Collaboration:

- Future ATS may be designed to collaborate more effectively with human operators. This collaborative approach, known as cobot (collaborative robot) technology, combines the strengths of both humans and robots to enhance overall productivity and flexibility.

8. Augmented Reality (AR) in Training and Maintenance:

- The integration of augmented reality in training and maintenance procedures can enhance the skills of operators and simplify troubleshooting processes. AR interfaces can provide real-time information, improving the efficiency of maintenance tasks.

9. Global Supply Chain Resilience:

- In the wake of global disruptions, such as pandemics and geopolitical challenges, there is an increasing focus on building resilient supply chains. ATS can play a role in achieving this resilience by automating processes and reducing dependencies on specific regions or labor forces.

10. Application in Emerging Industries:

- As new industries and technologies emerge, ATS will find applications in areas such as space exploration, renewable energy, and biotechnology. The adaptability of ATS to diverse trimming requirements positions it for integration into a wide range of emerging sectors.

11. Security and Ethical Considerations:

- Future ATS implementations will likely prioritize cybersecurity measures to protect against potential threats. Ethical considerations regarding the use of automation and AI in the workplace will also be important, influencing the design and deployment of ATS.

12. Global Standards and Regulations:

- The establishment of global standards and regulations for ATS will become increasingly important to ensure interoperability, safety, and adherence to ethical guidelines. Standardization will facilitate the widespread adoption of ATS across industries.

The future of ATS is intertwined with the broader evolution of manufacturing technologies, automation, and digitalization. As these trends progress, ATS will continue to evolve, providing innovative solutions to meet the ever-changing needs of industries seeking efficiency, precision, and sustainability.

Conclusion

In conclusion, the Automated Trimmer System (ATS) represents a transformative leap in precision machining, promising to reshape the landscape of industrial trimming processes. The comprehensive design, fabrication, and experimental implementation detailed in this paper underscore the potential of the ATS to address longstanding challenges in traditional trimming systems. Through meticulous attention to

design considerations, the proposed model exhibits a harmonious integration of advanced technologies, ensuring precision, adaptability, and efficiency across diverse applications.

The advantages of the ATS, including unparalleled precision, increased efficiency, and consistency in quality, position it as a valuable asset in industries where trimming plays a critical role. The adaptability of the system to various materials and geometries, coupled with its scalability and flexibility, enhances its relevance in dynamic manufacturing environments.

However, it is crucial to acknowledge the associated disadvantages, such as initial investment costs, complexity of integration, and potential resistance to change. These challenges highlight the importance of strategic planning, effective training programs, and ongoing support to maximize the benefits of the ATS implementation.

Looking ahead, the future scope of ATS appears promising, driven by advancements in robotics, automation, artificial intelligence, and Industry 4.0 initiatives. The integration of AI and machine learning, coupled with IoT connectivity, opens avenues for intelligent, data-driven decision-making and predictive maintenance, contributing to the evolution of smart manufacturing.

As the manufacturing landscape continues to evolve, the ethical considerations of automation, adherence to global standards, and a commitment to sustainability will play pivotal roles in shaping the trajectory of ATS. Furthermore, the potential applications of ATS in emerging industries and its role in fostering resilient global supply chains underscore its significance in the broader context of technological innovation.

In essence, the Automated Trimmer System stands at the forefront of a new era in industrial machining, offering a synergy of precision, efficiency, and adaptability. By navigating the challenges and embracing opportunities, the ATS emerges as a key player in advancing manufacturing capabilities and contributing to the ongoing paradigm shift toward intelligent and sustainable production processes.
